

passivHaus_Fenster

All round sensible, all round good

Resource-saving. Energy-efficient. Innovative.

passivHaus_Fenster – All round sensible

The window is the building element that allows the most efficient use of thermal insulation. With the right window combination, you can often save double-digit energy costs at slightly higher construction costs. Investing in windows is worthwhile.

SALAMANDER | passivHaus_Fenster make it possible to further optimise the energy efficiency of windows. With evoCore, the conventional steel reinforcement of the window is replaced all round by high-strength, thermally insulating recycled foam.

What makes the windows special are the small air bubbles, inspired by nature, that are enclosed in the recycled foam. Like birds that fluff up their feathers in winter to create additional tiny, heat-insulating layers of air, the micro-bionic evoCore insulation of the new SALAMANDER | passivHaus_Fenster is the element that raises a building to even higher passive house standards.

SALAMANDER | passivHaus_Fenster – All round good

Salamander inspires you in discovering the relevant potentials that are important when it comes to selecting windows. We take into account the geographical location of your home, the type and orientation of the building and your design preferences as well as the very specific energy and CO₂ savings. But “all round good” means even more to us: the application of recycled foam instead of steel from energy- and material-intensive production reduces the ecological footprint considerably right from the start!

With up to 25 % less weight of the windows equipped with evoCore, we not only reduce CO₂ in transport – your fitter will also appreciate your decision. And you take responsibility for the next generation: if your new windows do eventually need to be replaced, we guarantee one hundred percent design-for-recycling by making the PVC and PET easy to separate.
